

MEHMOOD UL HAQ

Frontend / Full-Stack / Software Engineer • Stockholm, Sweden

PROFILE

Software engineer with strong full-stack JavaScript/TypeScript experience. I build data-intensive interfaces, real-time workflows, and maintainable product architecture across modern and legacy systems. My work spans Angular, React, Node.js/NestJS, analytics visualization, testing, and production-oriented integrations.

CORE STRENGTHS

Frontend architecture

Angular, React, TypeScript, NgRx/Redux, reactive state, complex forms and workflows

Visualization

Highcharts, maps, time-series analytics, interactive tables, exports and performance-aware rendering

Data & APIs

GraphQL, REST, Node.js, NestJS, data transformation, pagination and filtering

Quality

Jest, Jasmine, Cypress, accessibility testing, code review, CI/CD and observability

PROJECT EXPERIENCE

IT & Network Analytics | Enterprise video-performance diagnostics

One of my primary product areas at Hive Streaming. I worked across the Angular/NgRx investigation experience and the GraphQL analytics backend, including data transformations, visualizations, API/resolver work, and production debugging.

Stack: Angular 21, TypeScript, NgRx, GraphQL, Highcharts, NestJS, PostgreSQL

- Built and maintained investigation flows that move from cross-event trends to event, site, system-part, and viewer-level diagnostics.
- Worked with time-series analytics, filters, server-side pagination, maps, reliability/playback metrics, and persistent diagnostic context.
- Contributed to typed GraphQL services that aggregate multiple data sources into frontend-ready analytical responses.

Hive Focus | Audience engagement analytics

Contributed across the Angular analytics experience and its secured GraphQL feature module, connecting state, visualizations, privacy-aware presentation, and backend analytics contracts.

Stack: Angular 21, NgRx / Signal Store, GraphQL, Highcharts Maps, NestJS, PostgreSQL

- Implemented and supported event discovery, attentiveness summaries, minute-level trends, distributions, and geographic analysis.
- Handled empty states, live-versus-completed event behavior, filtering/paging, and privacy-aware presentation for small audience groups.

Headless Portal CMS | Structured content management

Worked on a headless CMS that decoupled editorial content from frontend release cycles and exposed structured content to a separate portal.

Stack: Node.js, TypeScript, Keystone 6, GraphQL, PostgreSQL, Prisma, NextAuth/Auth.js

- Worked with structured content models, role-based editorial workflows, GraphQL delivery, audit metadata, and deployment-aware administration.
- Supported rich text, reusable page components, content relationships, and environment-specific configuration.

Hypertype | AI email assistant

Worked on a React/TypeScript product spanning a web dashboard and Gmail Chrome extension. The product used company knowledge and prior communication to help users generate contextual email replies inside Gmail.

Stack: React, TypeScript, Chrome Extension MV3, Firebase, Node.js/Express, REST

- Worked across dashboard, extension, shared packages, authentication, source-management workflows, and streamed reply UX.

- Integrated dynamic Gmail UI using injected React components and DOM observation while preserving the host application experience.
- Supported knowledge-source workflows, reply editing, source visibility, feature flags, analytics, and error monitoring.

FurhatGPT | Character management & robot/simulator control

Built integration-heavy React frontend workflows for configuring AI personas and running them across cloud environments, local robots, and a simulator.

Stack: React 18, TypeScript, Vite, REST, WebSockets, Tailwind/NextUI, Unity/WebGL integration

- Worked on authentication, persona lifecycle, responsive editing flows, cloud/local runtime selection, and real-time conversation state.
- Coordinated REST and WebSocket behavior with resource lifecycle and simulator/robot availability.

Zong Telecom Location & Geofencing Portal | Legacy operations platform

Maintained and extended a mature Angular portal for location requests, operational dashboards, mapping, zone management, bulk data workflows, and audit-oriented reporting.

Stack: Angular 6, RxJS, Angular Material, Highcharts, Google Maps, REST/SOAP, CSV/XLSX

- Implemented complex map/table/filter/upload/export workflows across multiple telecom services.
- Worked within legacy constraints while preserving behavior, operator feedback, and integration compatibility.

Telecom / USSD Management Platform | Multi-portal service & campaign system

Worked across an Angular/Node platform with separate administration, service configuration, and campaign portals connected to telecom and charging integrations.

Stack: Angular 12, Node.js/Express, REST, Sequelize/MariaDB, file processing, JWT/WSO2, telecom integrations

- Built and maintained operational forms, user/quota workflows, subscriber-list processing, service/menu configuration, and campaign management.
- Worked across frontend and backend boundaries in a legacy production system with domain-specific integration constraints.

ENGINEERING APPROACH

Make complex state explicit	Design around contracts	Optimize for maintainability
Model filters, async requests, derived analytics, selection context, and failure states so the UI remains predictable under rapid user interaction.	Keep frontend and backend assumptions explicit: pagination, time zones, empty/error semantics, authorization scope, and data transformation boundaries.	Prefer clear domain boundaries, reusable components/services, focused state management, test coverage, and incremental modernization over risky rewrites.

TECHNICAL TOOLKIT

Frontend	Angular, React, AngularJS, TypeScript, JavaScript, NgRx, RxJS, Signals, Storybook, Tailwind/Bootstrap
Backend & API	Node.js, NestJS, Express, GraphQL, REST, Prisma
Data & visualization	PostgreSQL, Firebase/Firestore, Redis, Highcharts, maps, TanStack tables, CSV/XLSX workflows
Testing & delivery	Jest, Jasmine, Cypress, accessibility testing, CI/CD, Docker, Kubernetes
Production integrations	Authentication/authorization, feature flags, telemetry/logging, WebSockets, browser extensions, cloud services

WHAT I BRING TO A TEAM

- Experience taking features end to end: requirements clarification, architecture, implementation, API integration, testing, debugging, and production hardening.
- Comfort operating across frontend and backend boundaries when a UI issue is actually caused by data contracts, transformations, caching, or service behavior.
- Strong fit for data-heavy products where usability depends on clear state, responsive visualizations, careful filtering, and reliable asynchronous behavior.
- Practical experience maintaining mature systems while incrementally improving code quality, architecture, testability, and developer experience.

This portfolio intentionally summarizes project work at a professional, non-confidential level. Project descriptions distinguish my contribution from broader product capability.
